

Demarcation

For a long time the island of Bytopia was ruled by the fair king Byteasar. But after the sudden death of the king, his two sons—twins Biteon and Byteon—could not come to an agreement which one of them should ascend the throne. Therefore they decided to divide the island into two provinces to rule them independently.

On a rectangular map Byteotia is shaped as a polygon of N vertices. Every side of the polygon is parallel to a side of the map, and every two consecutive sides are perpendicular to each other. No side of the polygon crosses or touches any other side, except for the common endpoints of consecutive sides.

Biteon and Byteon want to divide the polygon into two congruent polygons, using one line segment contained in the polygon and parallel to a side of the map. (Two polygons are congruent if one can be transformed into the other using a combination of reflections, rotations and translations.) Coordinates of the polygon vertices and the endpoints of the dividing segment are integers.

The king's sons asked you to verify whether such a division is possible.

Task

Given the shape of the island, determine if it can be partitioned by a horizontal or vertical segment into two congruent pieces. If it can, find one such segment.

Input

The first line of the input contains a single integer N , the number of vertices. The i th of the next N lines contains a pair of integers X_i and Y_i ($0 \leq X_i, Y_i \leq 10^9$) which are the coordinates of the i th vertex.

The vertices are given in order, i.e. the line segments $(X_1, Y_1) - (X_2, Y_2)$, $(X_2, Y_2) - (X_3, Y_3)$, \dots , $(X_{N-1}, Y_{N-1}) - (X_N, Y_N)$ and $(X_N, Y_N) - (X_1, Y_1)$ are all sides of the polygon. Furthermore, any two consecutive line segments are perpendicular to each other.

Output

Your program should output a single line. If it is possible to divide the island into congruent parts with a horizontal or vertical segment with endpoints (x_1, y_1) and (x_2, y_2) , print 4 integers x_1, y_1, x_2 and y_2 , separated by spaces. Either $x_1 = x_2$ or $y_1 = y_2$ must hold. The segment should be contained within the polygon and only its endpoints should touch the boundary.

If a suitable division cannot be found, output a single word NO.

Examples

Input	Output	Comments
10 0 0 1 0 1 1 3 1 3 5 2 5 2 3 1 3 1 2 0 2	1 2 3 2	Note that 3 2 1 2 is also a valid solution. 

Input	Output	Comments
6 0 0 1 0 1 1 2 1 2 2 0 2	NO	In this case there is no way to divide the island into two congruent parts. 

Scoring

Subtask 1 (12 points). $4 \leq N \leq 100\,000$. Any horizontal or vertical line that divides the polygon divides it into exactly two parts.

Subtask 2 (15 points). $4 \leq N \leq 200$.

Subtask 3 (23 points). $4 \leq N \leq 2\,000$.

Subtask 4 (50 points). $4 \leq N \leq 100\,000$.

Constraints

Time limit: 0.5 s.

Memory limit: 256 MB.
